

Jake Crouch

1) Selenium gives you a powerful way to test a web site and the interaction between a browser and a web site.

2) Selenium does not appear to have any drawbacks to develop web sites. It could possibly be a problem that you could not always use record if perhaps you needed to test a functionality that isn't able to be performed and recorded.

3)<tr><td>ComputerScience</td></tr>

4)<tr>
<td>click</td>
<td>//a[@id='myLink']/</td>
<td></tr>

5) HTML is a scripting language so it is very good for a test for websites, however its downfall is that you cannot use Selenium well unless you know the HTML language well first which I do not.
